TMD SMART Unit

The SMART Unit provides reduced levels of contaminants of household wastewater.

The TMD SMART (Sewage Microbial Amendment Reactor) Unit consists of inoculated microbes tailored to mineralize constituents found in household wastewater. The SMART Units are designed to be installed as part of, or connected to an individual residential septic system to treat and reduce levels of contaminants such as:

- BOD
- TSS

- NO3
- PO4

The TMD SMART Unit provides effluent waters that when released are beneficial for drain field remediation. With a reduction in contaminant levels, the drain fields are opened and allowed to perform more efficiently.
